Amendments In the Claims

Please cancel Claims 7, 12, 27-29 and 32-33. Please amend Claims 1-6, 8, 11, 13, 17-19 and 22-26 as follows:

1. (Currently Amended) A method comprising:

receiving input data comprising a plurality of integration objects, wherein including a hierarchy of instances of object components; and the plurality of integration objects are hierarchically related, each of the plurality of integration objects comprises information, the plurality of integration objects comprises a first and second integration object, and

the second integration object is a child object of the first integration object; and

- modifying performing a database modification process in response to the input data, the modifying the database modification process comprising comparing finding a first database record matching with the first integration object a higher-level component instance within the hierarchy.
 - modifying updating the first matching database record using the information associated with the first integration object, if the first database record matches information associated with the first integration object based on the higher-level component instance,
 - finding <u>one or more</u> a set of child database records associated with the <u>first database record</u> higher-level component instance,
 - modifying one or more of the updating the set of child database records

 using the information associated with the second integration
 object, if the second integration object comprises a record
 matching a corresponding record in the one of the one or more
 child database records based on a first set of lower-level
 component instances within the hierarchy, each instance in the

first set of lower-level component instances having a matching record in the set of child database records, and inserting a new database record[[s]] comprising the information associated with the second integration object, if the second integration object does not comprise a record matching a corresponding record in one of the one or more child database records, wherein based on a second set of lower-level component instances, the instances in the second set of lower-level component instances not having matching records in the set of child database records.

the one or more child database records comprises the new

database record.

2. (Currently Amended) The method of claim 1, wherein the database modification process further comprises:

deleting <u>a</u> record[[s]] from the <u>one or more</u> set of child database records, <u>if</u> the record[[s]] <u>does</u> <u>deleted</u> not <u>have a having</u> matching <u>integration object</u> <u>eomponent instances</u> in the hierarchy.

3. (Currently Amended) The method of claim 1, wherein finding the <u>first</u> database record matching the <u>first integration object</u> <u>higher-level component instance</u> comprises:

extracting a set of userkey[[s]] related to an object type of the <u>first integration</u>

<u>object higher-level component instance</u>;

utilizing the set of userkey[[s]] to find the first matching database record.

- 4. (Currently Amended) The method of claim 3 wherein: the finding <u>comprises</u> includes utilizing SQL queries directed to the database.
- 5. (Currently Amended) The method of claim 2 wherein: the deleting further <u>comprises</u> includes cascaded deleting.

Serial No.: 09/846,920

- 6. (Currently Amended) A method comprising:
- receiving input data comprising a plurality of integration objects, wherein including an external hierarchy of instances of object components;

the plurality of integration objects are hierarchically related,
each of the plurality of integration objects comprises components,
the plurality of integration objects comprises a first and second
integration object, and

the second integration object is a child object of the first integration object; and

- modifying the plurality of integration objects using a database, said

 modifying performing a modification process for a local group of
 instances of object components in response to the input data, the
 modification process comprising
 - comparing finding a first database record with the first integration

 object, in the local group, a local instance matching a higherlevel external instance within the external hierarchy,
 - updating the local instance based on the higher-level external instance,
 - modifying the first integration object using data from the first
 database record, if the first database record matches
 information associated with the first integration object,
 - finding one or more a set of child database records associated with the first database record local instances associated with the higher-level external instance,
 - updating the set of child local instances based on a first set of lowerlevel external instances within the external hierarchy, the external instances in the first set having matching child local instances, and
 - modifying the second integration object using data from one of the one or more child database records, if the second integration

object comprises a record matching a corresponding record in the one of the one or more child database records, and inserting a new integration object comprising data from one of the one or more child database records, if the one of the one or more child database records does not comprise a record matching a corresponding record in the second integration object, wherein new local instances into the local group based on a second set of lower-level external instances, the external instances in the second set not having matching local instances in the set of child local instances.

the new integration object is a child of the first integration object.

- 7. Canceled.
- 8. (Currently Amended) The method of claim 6 [[,]] wherein the finding the first database record matching the first integration object, in the local group, the local instance matching the higher-level external instance comprises:

extracting a set of userkey[[s]] related to an object type of the <u>first integration</u>

<u>object higher-level external instance</u>; and

utilizing the set of userkey[[s]] to find the <u>first database record</u> matching local instance.

- 9-10. Canceled.
- 11. (Currently Amended) An apparatus comprising:

means for receiving input data <u>comprising a plurality of integration objects</u>,

<u>wherein including an external hierarchy of instances of object</u>

<u>components; and</u>

the plurality of integration objects are hierarchically related,
each of the plurality of integration objects comprises components,
the plurality of integration objects comprises a first and second
integration object, and

the second integration object is a child object of the first integration object; and

means for modifying the plurality of integration objects using a database, the

modifying performing a modification process for a local group of
instances of object components in response to the input data, the
means for performing the modification process comprising
means for comparing finding a first database record with the first
integration object, in the local group, a local instance matching
a higher-level external instance within the external hierarchy,
means for updating the local instance based on the higher-level
external instance,

- means for modifying the first integration object using data from the

 first database record, if the first database record matches

 information associated with the first integration object,
- means for finding <u>one or more a set of child database records</u>

 <u>associated with the first database record local instances</u>

 <u>associated with the higher-level external instance</u>,
- means for updating the set of child local instances based on a first set
 of lower-level external instances within the external hierarchy,
 the external instances in the first set having matching child
 local instances, and
- means for modifying the second integration object using data from
 one of the one or more child database records, if the second
 integration object comprises a record matching a
 corresponding record in the one of the one or more child
 database records, and
- means for inserting a new integration object comprising data from one
 of the one or more child database records, if the one of the one
 or more child database records does not comprise a record
 matching a corresponding record in the second integration
 object, wherein new local instances into the local group based
 on a second set of lower-level external instances, the external

instances in the second set not having matching local instances in the set of child-local instances.

the new integration object is a child of the first integration object.

- 12. Canceled.
- 13. (Currently Amended) The apparatus of claim 11 wherein the means for finding the first database record matching the first integration object, in the local group, the local instance matching the higher-level external instance comprises:

 means for extracting a set of userkey[[s]] related to an object type of the first integration object higher-level external instance; and means for utilizing the set of userkey[[s]] to find the first database record matching local instance.
 - 14-16. Canceled.
- 17. (Currently Amended) A machine-readable medium embodying instructions, the instructions, when executed by a processor, causing the processor to perform a method, the method comprising:

receiving input data comprising a plurality of integration objects, wherein including a hierarchy of instances of object components; and the plurality of integration objects are hierarchically related, each of the plurality of integration objects comprises information, the plurality of integration objects comprises a first and second integration object, and

the second integration object is a child object of the first integration object; and

modifying performing a database modification process in response to the input data, the modifying the database modification process comprising comparing finding a first database record matching with the first integration object a higher-level component instance within the hierarchy,

modifying updating the first matching database record using the information associated with the first integration object, if the first database record matches information associated with the first integration object based on the higher-level component instance,

. . . .

finding <u>one or more</u> a set of child database records associated with the

<u>first database record</u> higher-level component instance,

modifying one or more of the updating the set of child database records

using the information associated with the second integration
object, if the second integration object comprises a record
matching a corresponding record in the one of the one or more
child database records based on a first set of lower-level
component instances within the hierarchy, each instance in the
first set of lower-level component instances having a matching
record in the set of child database records, and

inserting <u>a</u> new database record[[s]] <u>comprising the information</u>

<u>associated with the second integration object, if the second integration object does not comprise a record matching a corresponding record in one of the one or more child database records, wherein based on a second set of lower-level component instances, the instances in the second set of lower-level component instances not having matching records in the set of child database records.</u>

the one or more child database records comprises the new database record.

18. (Currently Amended) The machine readable medium of claim 17 [[27]], further embodying instructions, which, when executed by the processor, cause the processor to perform the method, wherein the database modification process further comprises:

deleting <u>a</u> record[[s]] from the <u>one or more set of</u> child database records, <u>if</u> the record[[s]] <u>does deleted</u> not <u>have a having</u> matching <u>integration object</u> <u>component instances</u> in the hierarchy.

19. (Currently Amended) The machine readable medium of claim 17 [[27]], further embodying instructions, which, when executed by the processor, cause the processor to perform the method wherein finding the <u>first</u> database record matching the <u>first integration object</u> higher-level component instance comprises:

extracting a set of userkey[[s]] related to an object type of the <u>first integration</u>

<u>object higher-level component instance</u>;

utilizing the set of userkey[[s]] to find the first matching database record.

20. (Previously Presented) The machine readable medium of claim 19, further embodying instructions, which, when executed by the processor, cause the processor to perform the method wherein:

the finding includes utilizing SQL queries directed to the database.

21. (Previously Presented) The machine readable medium of claim 20, further embodying instructions, which, when executed by the processor, cause the processor to perform the method wherein:

the deleting further includes cascaded deleting.

22. (Currently Amended) A system comprising:

a processor;

a memory coupled to the processor;

an interface, coupled to the <u>memory</u>, <u>processor</u>; <u>wherein the processor is</u>

<u>configured</u> to receive input data <u>comprising a plurality of integration</u>

<u>objects</u> <u>including a hierarchy of instances of object components</u>,

<u>wherein</u>

the plurality of integration objects are hierarchically related,
each of the plurality of integration objects comprises components,
the plurality of integration objects comprises a first and second
integration object, and

the second integration object is a child object of the first integration object; and

<u>a processor, coupled to the interface, and configured</u> to <u>modify perform</u> a database modification process in response to the input data, the database

modification process is performed by, wherein to modify the database the processor is further configured to

.

compare find a first database record matching with the first integration

object a higher-level component instance within the hierarchy,

modify update the first matching database record using the information
associated with the first integration object, if the first database
record matches information associated with the first
integration object based on the higher-level component
instance,

find <u>one or more</u> a set of child database records associated with the <u>first</u>

<u>database record higher-level component instance</u>,

modify one or more of the update the set of child database records

using the information associated with the second integration
object, if the second integration object comprises a record
matching a corresponding record in the one of the one or more
child database records based on a first set of lower-level
component instances within the hierarchy, each instance in the
first set of lower-level component instances having a matching
record in the set of child database records, and

insert a new database record[[s]] comprising the information associated
with the second integration object, if the second integration
object does not comprise a record matching a corresponding
record in one of the one or more child database records,
wherein based on a second set of lower-level component
instances, the instances in the second set of lower-level
component instances not having matching records in the set of
child database records.

the one or more child database records comprises the new database record.

23. (Currently Amended) The system of claim 22 wherein the processor further to modify the database, the processor is further configured to perform the database modification process to

delete <u>a</u> record[[s]] from the <u>one or more</u> set of child database records, <u>if</u> the record[[s]] <u>does deleted</u> not <u>have a having</u> matching <u>integration object</u> <u>component instances</u> in the hierarchy; and.

24. (Currently Amended) The system of claim 22 wherein the processor is to find the first database record matching the first integration object, the processor is further configured to higher-level component instance by

extract[[ing]] a set of userkey[[s]] related to an object type of the <u>first</u>

integration object <u>higher-level component instance</u>, and

utilize utilizing the set of userkey[[s]] to find the <u>first matching</u> database record.

25. (Currently Amended) The system of claim 24 wherein to find the database records, the processor is further configured to:

the processor to utilize SQL queries directed to the database for the find.

26. (Currently Amended) The system of claim 23 [[22]] wherein to delete the record, the processor is further configured to:

the processor to cascade delete for the delete.

27-33. Canceled.
